

9/18
 ClosetGraph? → LangGraph!
 Understanding hair types!!
 too many??
 hairstyles + accessories + makeup? → Future work

Stylist.IO → import your closet & get matches based on the occasion, weather [enable formality, **LAYERING!**]

5 Memory Management!! [So imp!]
 • sliding window? Summarization-session
 • Supervisor compaction [or turn count?]
 • long term memory → wardrobe
 not in session mem!
 Verify with token counts for long sessions
 readjust design based on feedback!
 skintone / facial features for makeup?

6 Deployment [Yay!]
 • hf? CPU basic, docker
 • dashboard layout w/ langfuse
 • UI fix for outfit count
 • Polished ReadMe?
 (or Grafana)

Design → LangGraph orchestration, persistent wardrobe mem
 • session mem. management, style-guide RAG, add state obj, decide deterministic, tricky examples for eval

Phase 1

wardrobe schema - plain text

create stylist agent → compute on text descriptions

wardrobe.json for persistence → 6 tops, 4 bottoms + 3 layers

→ id, name, category, layering
→ color in name

2 nodes → cartesian prod of categories
→ LLM call

Start

↓
generate-candidates - deterministic * all combinations
* includes layering

↓
stylist-supervisor - LLM judgement * infers occasion, formality, ranks
* reasons each candidate

↓
result - top 5 outfits (ranked & reasoning)

*eventual goal:

User

↓
orchestrator

→ browser agent
→ ... (retrieval?) tool?
→ research agent
→ stylist agent
→ vision agent
→ ... tools

Architectural Plan (Future:)

User (gives photos/text, occasion)

↓
Vision Agent (photo → item tag)

↓
Wardrobe [stored] (long term mem.)

↓
Candidate gen. + ownership validation (deterministic)

↓
LangGraph - ClosetGraph

↓
Stylist agent

↓
Style-guide RAG

↓
Research agent (occasion context)

↓
Web search

↓
Browser agent (weather, shopping)

↓
Tool call

↓
Outfit ranking + reasoning

Memory management

↓
Session mem.

↓
long-term mem.
